

Ticket Booking System Project

1. Dependency Injection

In this project, dependency injection is used to pass the required components (payment, notification, and repository) into the BookingManager instead of creating them inside the class. This makes testing easier because we can replace real components with mock objects and test each part separately.

2. Limitations of Mocking

A limitation of mocking is that it does not represent real system behavior perfectly. Sometimes tests pass using mocks, but the real system may fail due to integration issues. This means unit testing alone is not always enough.

3. Team Contribution

Haitham → Implemented the BookingManager logic

Mohamed → Developed and tested unit test cases using Mockito

Tareq → Prepared the project report and handled final submission
